Dear Hiring Manager,

I'm writing to apply for the Junior Software Engineer role on your team. I'm a software engineering student at the College of Western Idaho who ships real, working software, not just coursework, and I'd like to bring that habit to your team.

Over the past year I've designed and built Proviso, a provider credentialing web app on React, Vite, Tailwind, and Supabase, with row level security policies scoping data per account. I built a Flask billing automation portal that ingests spreadsheets, normalizes them, and reports on claim status end to end. I also shipped two Unity game builds, including a procedurally generated 18-hole golf simulation with a custom render-texture scoring system, and a collectible-card basketball game backed by a Supabase database. Outside of my own projects, I've handled the freelance side too, launching a live client site with a custom domain, SSL, and automated GitHub-to-Netlify deployment, plus a full brand system for the business behind it.

What I look for in a team is work that real people actually depend on day to day, not just a portfolio piece or a demo. That's exactly how I like to build: starting from the data model and the API, then working up to an interface that holds together under real use.

I've attached my resume, which goes into more detail on the stack and the work. I'd welcome the chance to talk about how I could contribute to your team.

Sincerely,
Marshal Wahl
